

PROJECT REPORT

TABLEAU SALES DASHBOARD

SUBMITTED BY
MEGHA L NARAYANAN

INTRODUCTION

This project focuses on developing an interactive Sales Dashboard using the data visualization tool Tableau. The main objective of the project was to analyze sales performance, profit distribution, order details, and customer insights through meaningful visualizations and KPI indicators. The dashboard was designed to provide a clear understanding of business performance and help in decision-making through interactive charts and hierarchical analysis.

The project includes sales analysis based on categories, regions, salespersons, and shipping duration. Different Tableau features such as calculated fields, KPI cards, hierarchies, conditional logic, drill-down analysis, and dashboards were used to create an informative and user-friendly report.

DATASET DESCRIPTION

The dataset used in this project contains detailed sales transaction records of a business and was utilized to perform various analytical tasks in Tableau. It includes important information related to orders, products, customers, sales performance, shipping details, and regional business operations. The dataset consists of columns such as Order ID, Order Date, Ship Date, Category, Sub-Category, Sales, Profit, Region, Country, State, City, and Salesperson details. Using this data, different analyses such as category-wise sales analysis, region-wise profit analysis, top salesperson identification, and shipping duration calculation were performed. The dataset also supported the creation of KPI cards, hierarchical drill-down analysis, and conditional logic visualizations, making it suitable for developing an interactive and informative sales dashboard.

TASK PERFORMED IN TABLEAU

1. Sales Dashboard Creation

A professional sales dashboard was created with proper alignment, formatting, titles, and visual arrangement. Multiple charts and KPI cards were combined into a single interactive dashboard for easy business analysis.

2. Category-wise Sales Analysis

A visual representation was created to display total sales based on different product categories. Bar charts were used to compare sales performance among categories.

3. Calculated Column – Order Duration

A calculated field was created to find the number of days between Order Date and Ship Date using Tableau calculation functions.

Formula Used

DATEDIFF('day', [Order Date], [Ship Date])

The order duration for the first 10 Order IDs was displayed in a table format.

4. Top Salesperson Identification

The top 2 salespersons were identified based on total sales generated. A suitable visualization was created to compare their performance.

5. Region-wise Profit Analysis

A visual analysis was performed to show total profit earned across different regions using charts.

6. KPI Cards Creation

KPI cards were created to display important business metrics such as:

- Total Orders
- Total Sales
- Total Profit

7. Hierarchical Sales Analysis

A hierarchy was created in the order:

Region → Country → State → City

Drill-down and drill-up functionalities were enabled to analyze sales at different geographical levels.

8. Conditional Logic & Visualization

An IF condition was applied to categorize sales data.

Condition Used

```
IF [Category] = "Clothing" AND [Sub-Category] = "Shirt"  
THEN "Shirt Sale"  
ELSE "Other Sale"  
END
```

A visualization was created to show total sales based on this condition.

OUTPUT OF TABLEAU VISUALISATION

SALES DASHBOARD

TOTAL ORDERS

500

TOTAL SALES

213,366,225

TOTAL PROFIT

43,840,676

REGION WISE TOTAL PROFIT

CATEGORY WISE TOTAL SALES

ORDER DURATION OF FIRST 10 ORDER ID

SHIRT SALE VS OTHER SALE

HIERACHICAL SALES ANALYSIS

TOP2 SALESPERSON BASED ON TOTAL SALES

CONCLUSION

The dataset used in this project contains detailed sales transaction records of a business and was utilized to perform various analytical tasks in Tableau. It includes important information related to orders, products, customers, sales performance, shipping details, and regional business operations. The dataset consists of columns such as Order ID, Order Date, Ship Date, Category, Sub-Category, Sales, Profit, Region, Country, State, City, and Salesperson details. Using this data, different analyses such as category-wise sales analysis, region-wise profit analysis, top salesperson identification, and shipping duration calculation were performed. The dataset also supported the creation of KPI cards, hierarchical drill-down analysis, and conditional logic visualizations, making it suitable for developing an interactive and informative sales dashboard.
